

Go to and install and download and create project

<https://docs.cloud.google.com/sdk/docs/install-sdk>

After installation open cli and run

```
gcloud init
```

1

Login and then 1

Select project or enter project id

Make folder and create your project inside it

```
mkdir appengine-demo
```

```
cd appengine-demo
```

```
Index.html
```

```
<!DOCTYPE html>
<html>
<head>
  <title>Google App Engine</title>
</head>
<body>
  <h1>Hello Google App Engine</h1>
  <h2>Welcome to Google App Engine</h2>
  <h4>Google App Engine is a fully managed serverless platform for
developing and hosting web applications at scale. With App Engine, you can
focus on writing code without worrying about infrastructure management, as
it automatically handles scaling, load balancing, and security.</h4>
</body>
</html>
```

```
App.yaml
```

```
runtime: python311

handlers:
- url: /
  static_files: index.html
  upload: index.html

- url: /(.*)
  static_files: \1
  upload: (.*)
```

Now run:

```
gcloud app deploy
```

If error:

<https://console.cloud.google.com/home/dashboard?project=tyachi>

id taka.

THEN GO TO-API AND SERVICES

Then search and enable these three apis:

- App Engine Admin API

- Cloud Storage API

- App Engine Admin API

Then again run

- gcloud app deploy
